

Neural Networks

A neural network is a model made of layers of connected neurons. Each neuron applies weights to its inputs and an activation function. The diagram below shows the architecture of the network.

Training Code

Training repeats forward and backward passes over the data.

```
def train(model, data):  
    for x, y in data:  
        loss = model(x) - y  
    return loss
```
